Abstract: Workforce Management System

The Workforce Management System is a web-based application designed to help organizations efficiently manage their workforce by organizing, assigning, and tracking tasks. Built using the MERN stack (MongoDB, Express.js, React.js, Node.js), the system provides a user-friendly interface for overseeing employee workloads, improving collaboration, and ensuring timely task completion.

Key features include task creation, assignment, and categorization, as well as tools for tracking work progress and identifying employees who have not been assigned any tasks. Managers can monitor workforce productivity on an interactive dashboard, track real-time updates, and view detailed progress reports. The system also supports role-based access, communication through comments, and integrations with calendars for better scheduling.

This application is ideal for managing team-based workflows and improving workforce efficiency, offering a comprehensive platform to streamline task distribution, track performance, and optimize resource utilization.
